

Chart A1 — Sales by Year, split by Product Line (Stacked Column)

1. Which year has the highest total sales?
2. Which product line is the largest segment in every single year?
3. Between 2003 and 2004, did total sales go up or down? By roughly how much?
4. Name the two smallest product-line segments in the chart. Do they stay small across all three years?

Chart A2 — Quantity Ordered by Deal Size, split by Year (Stacked Column)

1. Which deal size category has the tallest bar overall?
2. In which year was total quantity ordered the highest?

Chart A3 — Order Status by Territory (Stacked Column)

1. Which territory has the most total orders?
 2. Which territory has zero (or almost zero) "Cancelled" orders?
 3. Is "Shipped" the majority status in every territory, or does one territory look different?
-

Chart B1 — Sales by Country (Top 10), split by Product Line (Stacked Bar)

1. Which country has the longest bar (highest total sales)?
2. Is the #1 country's total sales more than double the #2 country?
3. For the top country, which product line makes up the largest chunk of its bar?
4. Pick any two countries in the Top 10 — do they have the same "shape" (same product line as their biggest segment), or different?

Chart B2 — 100% Stacked Bar: Deal Size mix per Territory

1. Across all territories, is "Medium" or "Small" the bigger share almost everywhere?
2. Which territory has the highest share of "Large" deals?
3. Do any two territories have an almost identical mix (bars that look nearly the same proportionally)?

4. Why might a manager prefer this 100%-stacked view over the plain stacked version in A2 when comparing territories of very different total size?

Chart B3 — 100% Stacked Bar: Quantity Ordered by Product Line, split by Quarter

1. For most product lines, which quarter takes up the largest share of the bar?
 2. Is there a product line where Q4 is clearly bigger than the other three quarters combined? What might explain that (think: holiday season)?
 3. Which product line's quarters look the most evenly split (no dominant quarter)?
-

Chart C1 — Linked Dashboard (Stacked Column + Stacked Bar, filtered by Territory slicer)

1. Select "EMEA" in the slicer. What happens to both charts?
2. Which product line becomes visibly smaller (or disappears) when you filter to "Japan" only?
3. Using the slicer, find one territory where "Classic Cars" is NOT the top-selling product line.

Chart C2 — Drill-Down Stacked Column (Year → Quarter → Month)

1. Drill into 2004. Which quarter had the highest sales that year?
 2. Drill further into that quarter's months. Which single month is the biggest contributor?
 3. Compare the same quarter (e.g., Q4) across 2003 and 2004 — did it grow or shrink?
-

Instructor Answer Key (from the dataset)

A1

1. 2004 is highest (~\$3.9M); 2005 is lowest but only because the data ends part-way through 2005.
2. Classic Cars is the largest segment every year (2003: ~\$1.10M, 2004: ~\$1.34M, 2005: ~\$0.53M).
3. Sales rose from 2003 to 2004 across almost every product line.
4. 2005 is a partial year in the source data (orders stop mid-year), not a real decline.

5. Trains is consistently the smallest segment, with Motorcycles/Ships also small relative to Classic Cars and Vintage Cars.

A2

1. "Medium" deal size has the tallest bars overall (highest quantity ordered).
2. 2004 has the highest total quantity ordered across all deal sizes.
3. "Large" deals are consistently the smallest category — most orders are Small/Medium sized, meaning revenue is driven by order volume, not a few big deals.

A3

1. EMEA has the most total orders (~1,407), followed by NA (~1,074), APAC (~221), and Japan (~121).
2. Japan and APAC show effectively zero cancelled orders; EMEA and NA carry the (small) cancellation counts.
3. "Shipped" dominates in every territory (~85–95%+ of orders).
4. NA has the highest count of "On Hold" orders (38) relative to its size — worth flagging.

B1

1. USA has the longest bar (~\$2.99M in sales).
2. Yes — USA (~\$2.99M) is roughly 3x Spain, the #2 country (~\$1.02M).
3. Classic Cars is the largest segment for USA (~\$1.02M of its total).
4. Most top countries share "Classic Cars" as their biggest segment (USA, France, Spain, Australia, UK), so the shapes look fairly similar — a good discussion point about product-line dominance being global, not country-specific.

B2

1. "Medium" is the largest share in every territory (~58–60%).
2. NA has the highest share of Large deals (~9.6%), narrowly ahead of EMEA (~8.9%).
3. All four territories look quite similar proportionally (Medium ~58–60%, Small ~30–36%, Large ~5.5–9.6%) — a good example of "same shape, different size" bars.
4. 100% stacked removes the effect of territory size (EMEA/NA are much bigger than APAC/Japan), letting you compare mix/composition fairly.

B3

1. Q4 is the largest quarter for every single product line.
2. Classic Cars: Q4 (~13,571 units) is nearly as large as Q1–Q3 combined (~20,421) — consistent with a holiday/year-end buying surge.
3. Motorcycles and Trucks and Buses have the most evenly distributed quarters relative to their totals.

C1–C2 (interactive — answers depend on live filtering, but talking points):

- Filtering to Japan shrinks or removes smaller product-line segments like Trains due to low order volume there.
- Q4 is the strongest quarter in both 2003 and 2004, and 2004's Q4 is larger than 2003's Q4 — consistent with overall year-over-year growth.
